

BEGINNER FRIENDLY

The DIY Automation Starter Kit

10 automations you can create with ANY AI - no coding experience required.

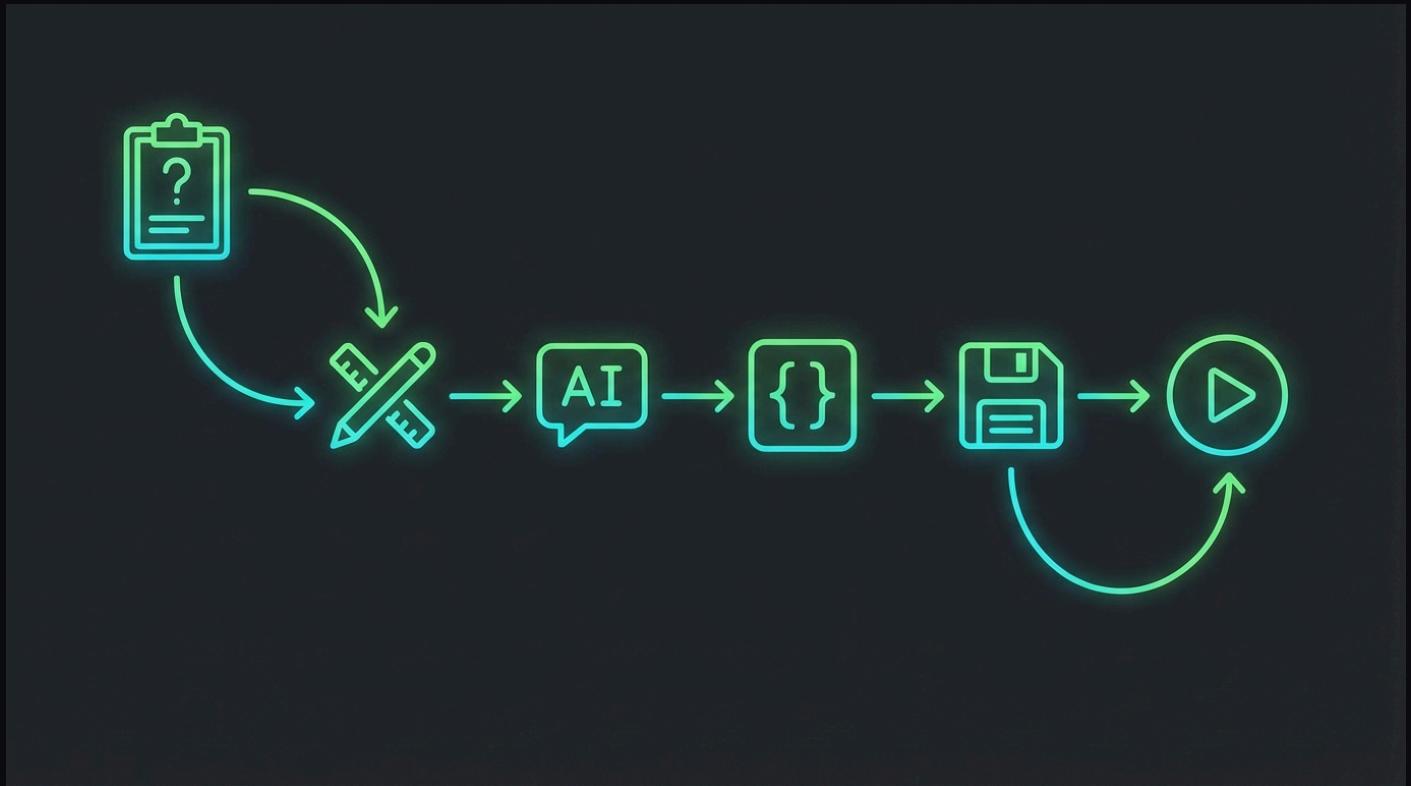

✓ Works with ChatGPT ✓ Works with Claude ✓ Works with Gemini

By Luis Aviles // Operations Architect

Your AI Automation Toolkit

Each automation includes: **The Prompt** (copy and customize), **Info to Provide** (what helps AI build it right), and **Pro Tips** (how to get better results).

#01

EXCEL / DATA

Auto-Format Report Macro

Formats your weekly report with consistent styling - one click instead of 15 minutes.

THE PROMPT

Create an Excel VBA macro that formats my [report type] report. Apply [company colors] to headers, set column widths, add borders, format numbers as [currency/percentage], freeze top row, add timestamp in [cell]. Data has [X] columns starting row [2].

PRO TIP

Ask AI to add a keyboard shortcut (Ctrl+Shift+F) so you can run it instantly.

#02

EXCEL / DATA

Data Cleanup Macro

Removes duplicates, trims whitespace, fixes formatting, standardizes text case.

THE PROMPT

Create an Excel VBA macro that cleans data: Remove duplicates based on [column], trim extra spaces, convert [column] to [UPPERCASE/Proper Case], standardize [phone/date] format, remove blank rows, sort by [column]. Show completion message with row count.

PRO TIP

Ask AI to create a backup sheet before cleaning so you can undo if needed.

#03

EXCEL / REPORTS

One-Click Dashboard Refresh

Refreshes all pivot tables, data connections, and recalculates formulas.

THE PROMPT

Create an Excel VBA macro that: Refreshes all pivot tables, refreshes all data connections/queries, recalculates all formulas, updates "Last Refreshed" cell to current date/time, shows completion message. Handle errors gracefully if any refresh fails.

PRO TIP

Ask AI to add a button to your dashboard sheet that runs this macro.

#04

FILE MANAGEMENT

Downloads Folder Organizer

Sorts downloads by file type into folders, renames with dates, cleans up old files.

THE PROMPT

Create a Python script that organizes my Downloads folder: Move PDFs to "Documents", images to "Images", videos to "Videos", installers to "Installers". Rename files to include date: originalname_2024-01-15.ext. Delete files older than [30/60] days (optional). Create subfolders if needed. Include a .cmd file to double-click run.

HOW TO DEPLOY

1. Save Python file as organize_downloads.py
2. Save .cmd file in same folder
3. Double-click .cmd to run
4. Optional: Add to Task Scheduler for daily runs

#05

EMAIL

Email Template Generator

Reads customer data from Excel and generates personalized emails ready to send.

THE PROMPT

Create a Python script that: Reads customer data from Excel (columns: [Name, Email, Company]), generates personalized emails using my template, saves each email as "email_[Name].txt", creates summary of all emails generated. Include .cmd file.

PRO TIP

Start with text files to review, then ask AI to add direct Outlook sending later.

#06

DATA TRANSFER

System-to-System Format Converter

Takes export from System A and reformats it for import into System B.

THE PROMPT

```
Create a Python script that converts data between formats: INPUT from [System A] : [CSV/Excel],  
columns: [list] OUTPUT for [System B] : [CSV/Excel], columns: [list] Column mappings: [A_Col →  
B_Col] Apply transformations: [date format, cleanup]. Save with timestamp.
```

INFO TO PROVIDE

- Sample export from System A (or exact format description)
- Import requirements for System B
- Data transformations needed

#07

TEXT PROCESSING

Clipboard Text Cleaner

Hotkey that cleans clipboard text - removes formatting, fixes spacing, standardizes.

THE PROMPT

```
Create a Python script that: Reads clipboard, cleans by removing extra whitespace/line breaks,  
converting smart quotes to regular, removing hidden characters. Puts cleaned text back in clipboard,  
shows notification "Cleaned!". Use pyinpyt for hotkey: [Ctrl+Shift+C].
```

PRO TIP

Ask AI to make it run on Windows startup so the hotkey is always available.

#08

EXCEL / DATA ENTRY

Data Entry Form Macro

Popup form for data entry with validation that adds to spreadsheet consistently.

THE PROMPT

Create an Excel VBA UserForm with fields: [Field1: text/dropdown] , [Field2: date] , [Field3: dropdown] . Validation: [Field] required, [Field] must be valid email. On submit: add to next empty row in [Sheet] , auto-fill today's date, clear form, keep open for more entries.

INFO TO PROVIDE

- All fields to capture (required vs optional)
- Dropdown options for list fields
- Which sheet/columns receive the data

#09

REPORTING

PDF Report Generator

Pulls data from Excel and generates a formatted PDF report.

THE PROMPT

Create a Python script that generates a PDF report: Read data from [Excel file] , create PDF with title "[Report Name]" , date generated, summary stats (total, average), data table with key columns. Use reportlab library. Save as "Report_YYYY-MM-DD.pdf". Include .cmd file.

Auto-Backup Script

Backs up important files/folders to backup location with dated folders.

THE PROMPT

Create Python script that backs up: Source folders: [paths]. Destination: [backup path]. Create dated folder (Backup_2024-01-15), copy files, skip unchanged files, log what was backed up, delete backups older than [30] days, show summary. Include .cmd and Task Scheduler instructions.

SCHEDULING (WINDOWS TASK SCHEDULER)

1. Open Task Scheduler → Create Basic Task
2. Set trigger (weekly, daily)
3. Action: Start program → your .cmd file
4. Done - runs automatically!

Quick Reference: What to Tell AI

Instead of...

Say this...

"Make it work with my files"

"Files are in C:\Reports, named report_MMYYYY.xlsx"

"Format the dates"

"Convert dates from MM/DD/YYYY to YYYY-MM-DD"

"Clean the data"

"Remove duplicates by email, trim whitespace, Title Case names"

You're Ready to Automate

Every automation in this guide started as a repetitive task someone was doing manually.

Now you have the prompts. You have the process. Pick one task that eats your time, copy the relevant prompt, customize it, and **ask AI to build it for you**.

You don't need to be a programmer. You just need to describe what you want clearly. AI handles the rest.

Start with one. Then build another. Before you know it, you'll have a toolkit of automations that save you hours every week.

THE PATTERN

Identify repetitive task → Ask AI to build a tool → Package it → Own it forever

The question isn't "can AI do this task for me?"

It's "can AI build something that does this task forever?"
